

modules/users/server/config/strategies

local.js: specifies local authentication strategy with a username & password.

It uses the mongoose User model & utilizes the function "findOne()".

modules/users/server/controllers

~~admin.server~~

users.server.controller.js:

specifies the exports of the ^{users} module by extending exports of

users.authentication.server.controller

users.authorization.server.controller

users.password.server.controller

users.profile.server.controller.

within modules/users/server/controllers/users via require statements.

→ This allows ^{auth}~~users~~.server.routes to bind account API endpoints by creating a users variable via a require statement for users.server.controller (see brace). These API endpoints such as 'api/auth/signup' allow for interaction with functions such as signup() (in this case) within users.authentication.server.controller through the created users variable.
